# 7-Seg LED

(a) 共陽極結構

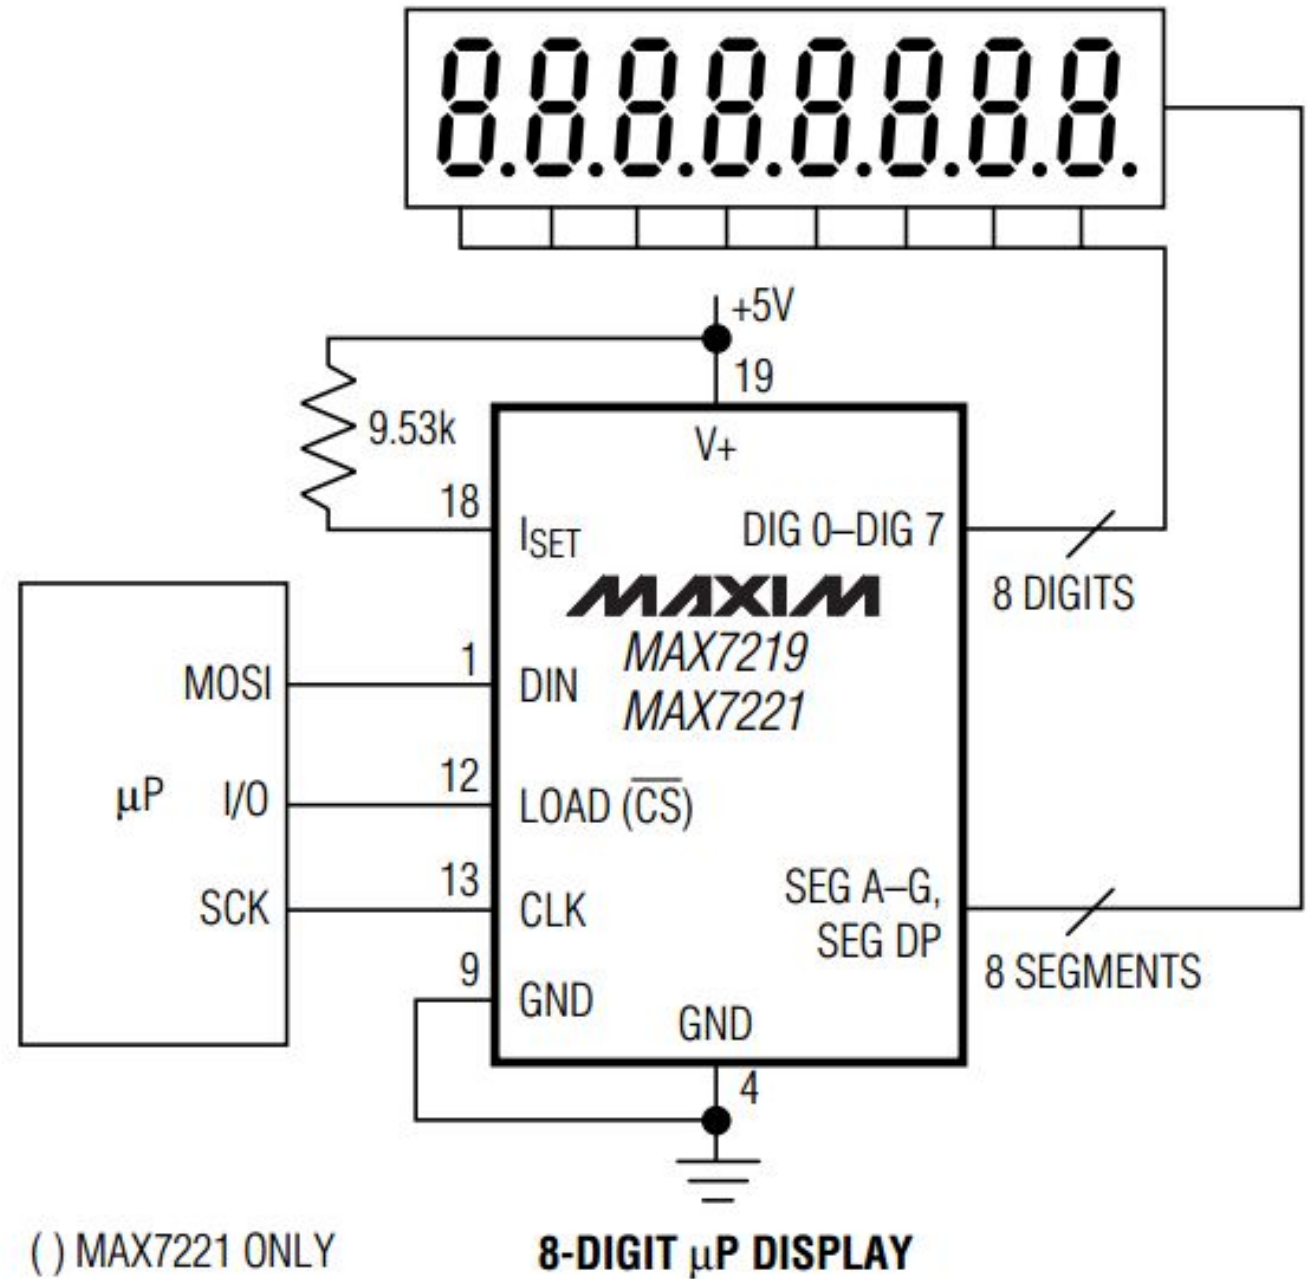

(b) 共陰極結構

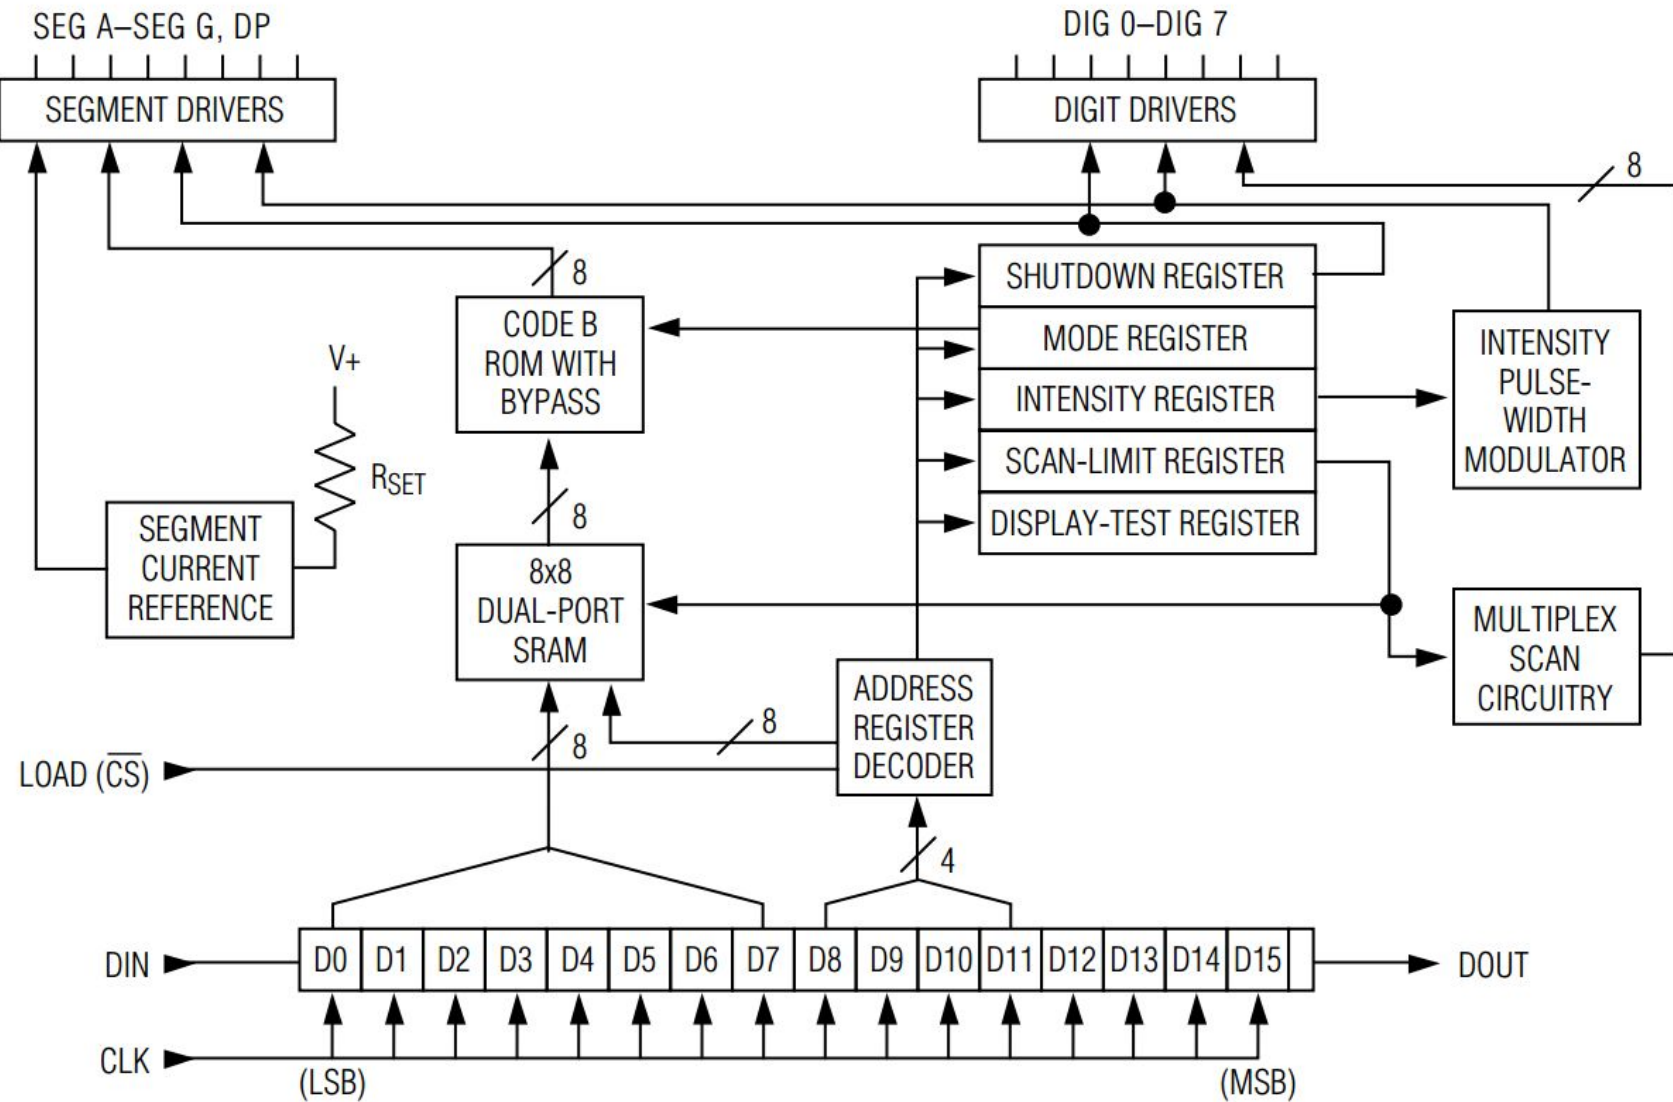

If we connect stm32 I/O pin on 7-Seg LED directly

- We use eight 7-Seg LED → We will need 16 GPIO pin!
  - We have to scan eight 7-Seg LED to show different number on it!
- We use Max7219 to simplify our work!!

# Max7219

# Max7219

# Max7219

- DIN: Serial-Data Input. Data is loaded into the internal 16-bit shift register on CLK's rising edge.
- CS: Load-Data Input. The last 16 bits of serial data are latched on LOAD(CS)'s rising edge.
- CLK: Serial-Clock Input. 10MHz maximum rate. On CLK's rising edge, data is shifted into the internal shift register.

Shutdown Mode	0xXC	X	X	X	X	X	X	X	0
Normal Operation	0xXC	X	X	X	X	X	X	X	1

When the MAX7219 is in shutdown mode, the scan oscillator is halted, all segment current sources are pulled to ground, and all digit drivers are pulled to V+, thereby blanking the display. Data in the digit and control registers remains unaltered.

\*The decimal point is set by bit D7 = 1

When the code B decode mode is used, the decoder looks only at the lower nibble of the data in the digit registers (D3–D0), disregarding bits D4–D6. D7, which sets the decimal point (SEG DP), is independent of the decoder and is positive logic (D7 = 1 turns the decimal point on)

Display digits 0 1 2 3 4 5 6 7	X	X	X	X	X	1	1	1	0x7

\*See *Scan-Limit Register* section for application.

The scan-limit register sets how many digits are displayed, from 1 to 8. The number of scanned digits affects the display brightness,

# Max7219—Display Test Register

**Table 10. Display-Test Register Format  
(Address (Hex) = 0xFF)**

MODE	REGISTER DATA

Normal Operation	X	X	X	X	X	X	X	0
Display Test Mode	X	X	X	X	X	X	X	1

**Note:** The MAX7219/MAX7221 remain in display-test mode (all LEDs on) until the display-test register is reconfigured for normal operation.

The display-test register operates in two modes: normal and display test. Display-test mode turns all LEDs on by overriding, but not altering, all controls and digit registers (including the shutdown register).

- Decode Mode: The value of D0~D3 will be decode as 7-Seg LED's 0~9,-E,H,L,P(space) if we set decode mode. Otherwise D0~D7 will display on 7-Seg LED directly(please check the picture of table 6)
- Intensity: To set the brightness of 7-Seg LED, increasing along with 0~15.
- Scan Limit: To set the number of digits will be display. 0 for 1 digit, 1 for 2 digit.....
- Shutdown: 7-Seg LED will be shutdown if we set the shutdown mode. It is a power saving mode.
- Display Test: For testing, will lighting all 7-Seg LED.

# Example

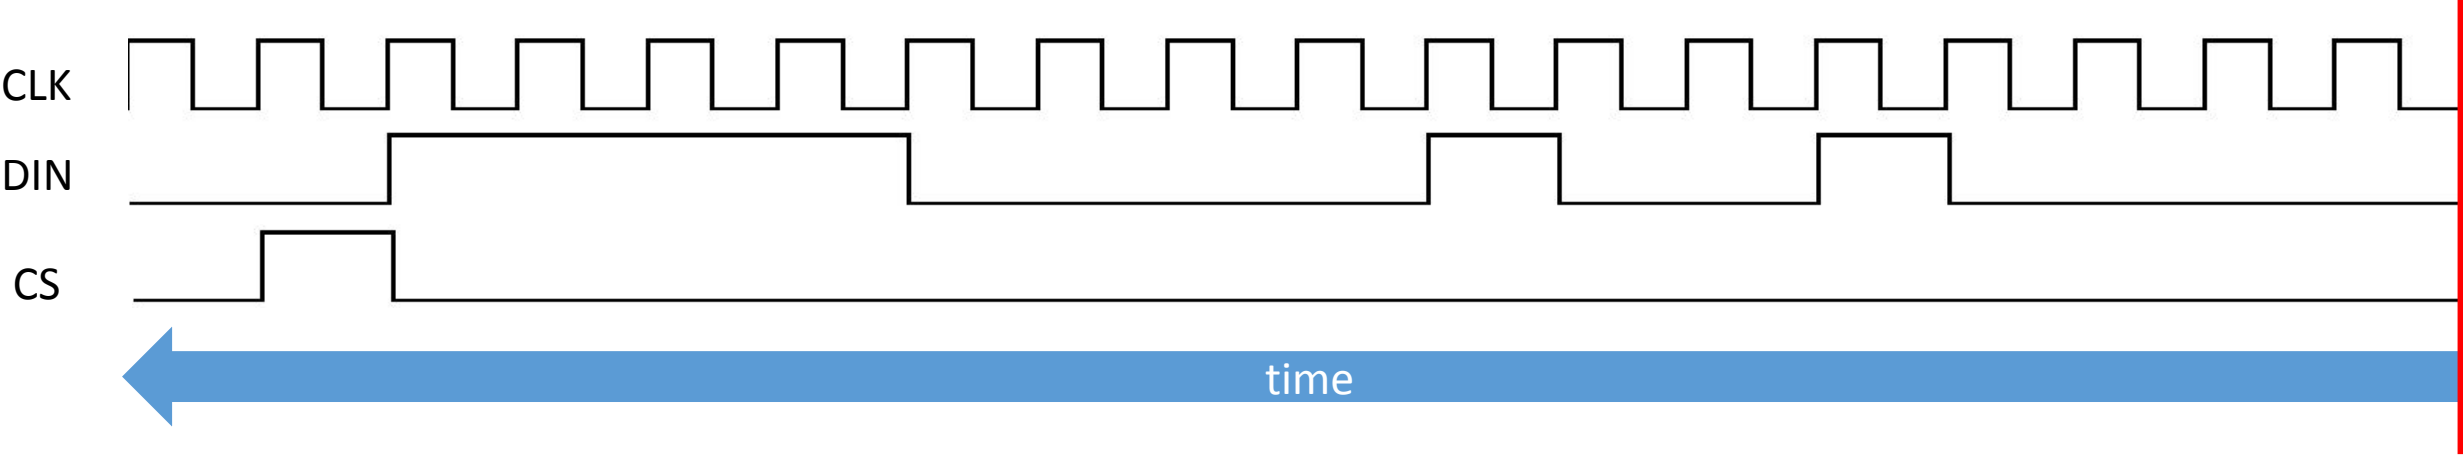

I want to set decode mode(Code B decode for digit 0-3, no decode for digits 4-7), thus I have to set Serial-Data as below!  
And then send a rising edge on CS pin to latch the Serial-Data!
